

# Georgia's 2025 economic outlook: balancing strong domestic growth with external headwinds

**Figure 1 – Georgia, Real GDP Growth Rate (Y/Y)**

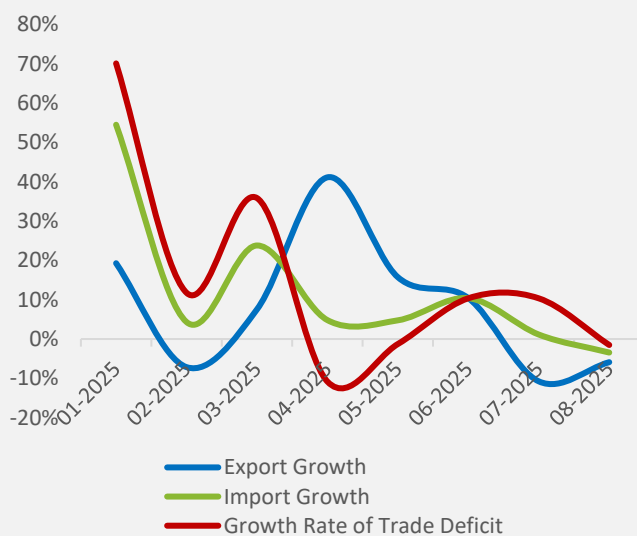

According to the ISET Policy Institute's latest projections, based on August's data, Georgia's economy is expected to grow by **5.8% in the third quarter** and **6.3% in the fourth quarter of 2025**. The annual growth in 2025 is expected to be **7.3%**.

# GEORGIA'S 2025 ECONOMIC OUTLOOK: BALANCING STRONG DOMESTIC GROWTH WITH EXTERNAL HEADWINDS

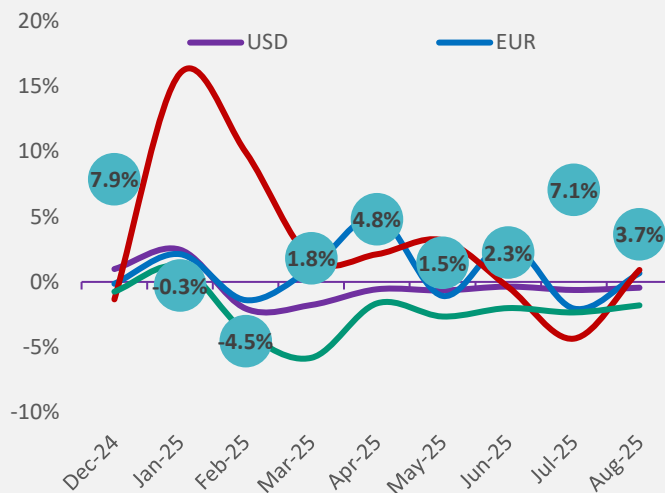

Among monetary indicators, in August 2025, the annual **14.6% rise in foreign currency deposits (FC\_DEPTOT)** signaled growing dollarization. At the same time, **national currency deposits increased (NC\_DEPTOT) by 8.3%** year-on-year, while the **M2 aggregate expanded by 10.8% YoY**, indicating more active monetary conditions and stronger demand-side dynamics. Overall, despite the rise in deposit dollarization (both in monthly and annual terms), monetary indicators positively contributed to the forecast.

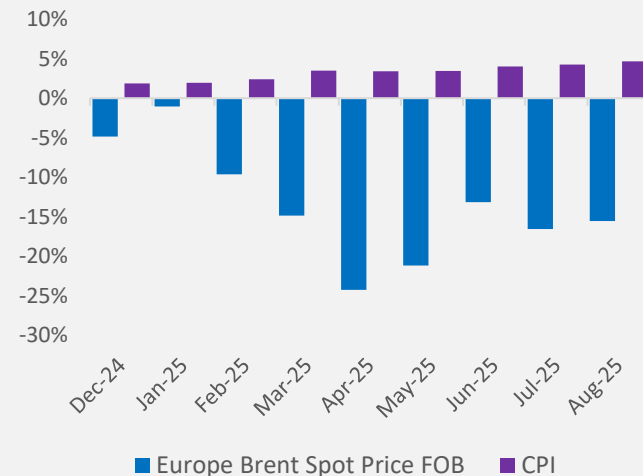

In August, **exports declined by 5.9%**, while **imports decreased by 3.4%**, leading to a **1.5% reduction in the trade deficit**. This improvement in net exports had a positive influence on the GDP forecast. The stronger trade balance provided a tangible short-term boost to economic activity, even though its long-term contribution to sustainable growth remains modest due to the composition of exports.

## GEORGIA'S 2025 ECONOMIC OUTLOOK: BALANCING STRONG DOMESTIC GROWTH WITH EXTERNAL HEADWINDS

In August, the **USD and TRY depreciated against the lari by 0.4% and 1.8%**, respectively, while the **EUR and RUB appreciated by 0.7% and 0.9%**. The overall impact of these exchange rate developments on the GDP growth forecast was positive. Meanwhile, official reserve assets increased by 3.7% month-on-month, indicating improved external liquidity conditions.

As of August 2025, **annual inflation stood at 4.6%**, above the **National Bank's 3% target**, but still reflecting a relatively stable price environment. Meanwhile, the **Euro Brent spot price declined by 15.5%** year-on-year, easing global cost pressures. While oil prices are an important input cost factor, inflation had a positive effect on the GDP forecast.

### GDP FORECAST METHODOLOGY

Our forecasting model is based on the Leading Economic Indicator (LEI) methodology developed by the *New Economic School*, Moscow, Russia. We have constructed a dynamic model of the Georgian economy, which assumes that all economic variables, including GDP itself, are driven by a small number of factors that can be extracted from the data well before the GDP growth estimates are published. For each quarter, ISET-PI produces five consecutive monthly forecasts (or "vintages"), which increase in precision as time passes. Our first forecast (the 1st vintage) is available around five months before the end of the quarter in question. The last forecast (the 5th vintage) is published in the first month of the next quarter.
