

GEORGIA'S ECONOMIC PERFORMANCE IN Q4 2024: STRONG GROWTH AMIDST STABILIZING INFLATION AND SHIFTING EXTERNAL DYNAMICS

Figure 1 - Real GDP Annual Growth Rate.

Source: *GeoStat, ISET-PI*

SUMMARY

According to [GeoStat's preliminary estimates](#) in the fourth quarter of 2024, Georgia's nominal GDP reached GEL 25,309.6 million, with a year-over-year real GDP growth of 8.3% and a GDP deflator change of 4.0%. The economic expansion was largely driven by strong growth in several key sectors. The most notable increases were observed in Education (+36.2%), Information and communication (+29.7%), Human health and social work activities (23.6%), Mining and quarrying (22.5%). These sectors played a major role in boosting overall economic activity. Conversely, the sharpest contractions were recorded in Activities of households as employers (-4.5%), Real estate activities (-2.3%), and Wholesale and retail trade (-0.2%), slightly offsetting the broader gains. The projected real GDP growth for 2025 from [NBG](#) is 5.0%, which is slightly above the WB projection of 4.5% y/y growth, but below the IMF projection of 6% y/y growth (Figure 1).

In the fourth quarter of 2024, the Georgian Lari (GEL) depreciated compared to the previous year. Over the same period the nominal effective exchange rate depreciated insignificantly. It should be noted that GEL appreciated against Lira by 16%. The REER depreciated by 0.4% on a quarterly basis and by 6.3% year on year. Also, it should be noted that the GEL real exchange rate appreciated against all main trading partners, except EU.

Georgia's stringent monetary policy has effectively curbed inflation expectations, bringing domestic inflation below the target level. The decrease in service prices has been a significant factor in this reduction, alongside the diminishing effect of previously increased apartment rental costs due to a surge in foreign visitors. These factors have collectively contributed to a more stable inflation rate, aligning with the country's monetary goals ([NBG, July 2024](#)).

Compared to the increasing unemployment in Q3 of 2023 (15.3%), the unemployment rate in Q4 of

2024 fell to 14.2 ([Geostat](#)). Average annual labor force participation has also increased by 0.6pp, reaching 54.9%. Based on [Geostat](#)'s preliminary estimate, in the fourth quarter of 2024, average monthly nominal earnings reached 2217.5 GEL.

In conclusion, **Georgia's economy in the fourth quarter of 2024 has shown robust growth with a notable increase in nominal GDP and real GDP growth. This positive trend is reflected across various sectors, particularly in information and communication, education, and Human health and social work activities. Despite a decline in foreign demand, domestic demand remains strong, with consumption remaining the primary driver of growth.**

INFLATION

Since the start of the year, inflation in Georgia has remained below its anticipated target and previous projections ([GeoStat](#)). This trend has led to a decline in inflation expectations, alongside an improved current account deficit. The latest forecast suggests that inflation will average around **1.2%** for 2024, which is higher than earlier estimates. Despite this, the strong economic performance is expected to continue, with real GDP growth projected at **8.5%** for the year. Consequently, while the initial stages of monetary policy normalization have been somewhat hastened due to lower inflation expectations, it is anticipated that any further normalization will proceed cautiously. This cautious approach is influenced by the potential risks arising from increased demand and ongoing uncertainties in both local and global geopolitical landscapes, which could lead to inflation rates exceeding the current forecast ([NBG, October 2024](#)).

To analyze inflation dynamics and market expectations, in addition to observing the overall inflation rate, the non-tradable sticky price index (NTSPI) developed by the Federal Reserve Bank of Atlanta provides valuable insights. The NTSPI, which measures inflation in consumer prices for goods and services with inflexible prices, averaged 1.97% in the fourth quarter of 2024, 0.13pp more than the previous quarter. Despite this small increase in NTSPI, these figures indicated that improved long-term inflation expectations and that market expects inflation to be below the target level. ([NBG](#))

In the fourth quarter of 2024 GEL's real effective exchange rate depreciated against all trading partner countries. This might be attributed to not just the short-term cyclical factors but also significant structural shifts in the current account, particularly since the onset of the Russia-Ukraine conflict in 2022. These shifts are evident in the growth of Georgia's service exports, especially in the information, computer, and transport sectors, bolstered by an influx of skilled migrants and the country's enhanced role as a key transit hub in the Middle Corridor. This strategic position has led to a notable rise in cargo turnover and logistics services exports through Georgia, suggesting that the normalization of the GEL's exchange rate might not necessitate substantial nominal depreciation.

Specific currency movements in the fourth quarter of 2024 included a 2.4% depreciation of the GEL against the US dollar and a 1.6% against the euro. The GEL appreciated by 15.5% against the Turkish lira and by 5.1% against the Russian ruble. Overall, the nominal effective exchange rate of GEL appreciated by 2.6%. However, the real effective exchange rate saw a 0.02% quarterly and 6.3% annual depreciation. ([NBG](#)).

In the fourth quarter of 2024, **deposit interest rates** in the national currency fell by 0.5pp compared to the previous year to 14.5%, while foreign currency deposit rates rose to **8.86%**. **Lending rates** also decreased, with mortgage and corporate loans in the national currency seeing a reduction, influenced by the cut in the monetary policy rate. The average interest rate for corporate loans dropped by **0.45**

percentage points from the previous year to **10.88%**.

Despite a rise in interest rates for foreign currency loans in 2023 due to global financial tightening, rates began to decline in 2024. The gap between local and foreign rates has lessened. Post-policy easing in May, rates for consumer, business, and mortgage loans all saw a decrease. Business loan demand grew in Q4 2024, and lending conditions for such loans in the national currency softened. However, the conditions have slightly tightened for business loans in foreign currency. The banking sector anticipates further mild relaxations in lending conditions for the upcoming quarter for both local and foreign currency loans.

Georgia's tight monetary policy has led to a decline in inflation expectations since last year, with domestic inflation stabilizing near the 3% target. As of December, inflation was at 1.9%, mainly due to long-term factors and expectations. Food and non-alcoholic beverages contributed 1.2 percentage points to the change, alcoholic beverages and tobacco 0.4pp, followed by health sector, contributing 0.35pp to overall inflation. This was partially balanced by decreasing prices in transportation and communication sector, contributing -0.47 and -0.18pp to inflation, respectively. ([Geostat, January 2025](#))

Imported goods prices, which had been falling since early 2023, thus reducing imported inflation, rose by 3.0% in December, which is 1.3pp more than the Q figure. This increase is largely attributed to an increase in the prices of electricity and Mining and quarrying activities. This might be caused by the ongoing geopolitical tensions in the Middle East, supply chain disruptions, and worsening climatic conditions which could exert upward pressure on international food prices.

EXTERNAL SECTOR: TRADE, TOURISM, REMITTANCES, FDI

At the start of 2024, Georgia experienced a decline in external demand, resulting in a significant drop in foreign currency inflows and domestic exports. However, later increases in foreign currency inflows helped improve the current account balance. In the second quarter, demand for motor vehicles and their re-exports slowed, leading to a decrease in export revenues. On the other hand, import expenses declined, and structural economic changes positively impacted the current account balance, particularly through increased service exports in the transport sector, driven by Georgia's promotion as a Middle Corridor country. Despite a decrease in exports of information and computer services, these sectors remained significant contributors to export revenues. Besides, rising revenues from international travel have supported an improvement in the current account deficit. As a result, the current account deficit improved to a historic low of 4.3% of GDP in 2023 and for 2024 is expected to be around 4.5-5.0%, which is considered to be a sustainable level.

In Q4 2024, external demand for motor vehicles led to an overall increase in Georgia's goods exports. Moreover, demand for ferro-alloys has risen again. In contrast, alongside a slowdown of construction activities in China, re-exports of copper ores and concentrates from Georgia were substantially low. Overall, in the fourth quarter, exports of goods grew by 19.3%. The increase in exports of goods was primarily driven by higher exports of consumer goods, including motor vehicles, alcoholic beverages, and mineral waters. Furthermore, the growth in exports of intermediate goods was positively influenced by the increased sales of ferro-alloys, semi-manufactured gold, and precious metals.

In the fourth quarter of 2024, Georgia saw a **4.5%** increase in international visitors compared to the previous year, yet this was still **25.8%** below the numbers seen before the pandemic. The rise in visitors from Belarus, and Ukraine, which began with the onset of the Russia-Ukraine conflict in 2022, has

since been on a decline. Also, number of visitors from Poland and Turkey has decreased by 26.7% and 12.3%, respectively. This slowdown of migration was balanced by the increasing visitor numbers from Israel (136.1%) and Russia (15.4%). Despite the higher visitor count, revenue from international travel grew by **10%** annually, reaching **USD 964 million**. ([GNTA, 2024](#)).

During Q4 2024, Georgia received USD 833million in instant money transfers, marking a 6.5% decrease from the previous year ([NBG](#)). This decline is attributed to a base effect and a reduction in transfers from Russia. The initial surge in transfers, linked to a one-time migration influx, has subsided. Nonetheless, despite the downturn in Russian transfers, remittances from other nations, notably the US, Israel, and the EU, have seen a significant uptick, buoyed by stronger economic performance in these regions.

Despite the initial downturn, demand for imported goods picked up in the fourth quarter of 2024, imports increased by 17.9% in nominal terms. Additionally, the sharp decline in purchases of motor vehicles intended for re-export limited the overall growth of goods imports. In 2024, despite a decrease in imports, Georgia's trade deficit widened as goods exports fell even more sharply. However, the country experienced a substantial increase in service exports, fueled by strong international trade revenues and structural changes in the service sector, particularly in transportation and IT services. Although wage growth was moderate, employee compensation remained high, contributing to a significant reduction in the current account deficit, which reached a record low of 5.0% of GDP, showing improvement in annual terms.

In the fourth quarter of 2024, long-term loan liabilities were the primary means of financing Georgia's current account deficit. Inward foreign direct investment (FDI) contributed less to the financing of the deficit. The FDI inflow increased by 10% from the previous year, totaling USD 0.57 billion, which represented approximately 2.6% of the country's GDP. This increase was mainly due to a increase in debt instruments and equity. The current account balance saw an improvement in 2023, largely attributed to a significant increase in savings, even though investment growth was only moderate. ([GeoStat](#))

PUBLIC FINANCES

According to the Ministry of Finance, current governmental expenditures amounted to 6,304.6 million GEL in the fourth quarter of 2024, showing a 22.3% y/y increase compared with the same period of previous year. This growth was mainly driven by higher spending on social benefits (+18% y/y) and wages (19.4%). Also remarkable was subsidies growth (+32.2% y/y), however grants declined by 29% y/y.

At the same time, total revenues to the general budget amounted to 6,610.5 million GEL, a 12.7% y/y increase. The latter was driven by the increased volume of Value Added Tax collection (26.3% y/y), taxes from the goods and services (6.3%). However, revenues from international trade has declines by 9% y/y. Overall, the budget surplus in Q4 of 2024 amounted -1,675.9million GEL (-6.6% of GDP) ([Ministry of Finance of Georgia, 2024](#)).

Central Government debt liabilities (which include both domestic and foreign debt) increased by 5.5% y/y and amounted to 33,134.9 million GEL in Q4, 2024. Furthermore, the share of foreign debt in total debt stood at 69.8%, slightly maintaining the country's exposure to exchange rate risk.
